

We have received a data file from a provider. It is called TheirData.xlsx. This file needs to be combined, with our data, to make one file. Taking the tracking ID from our data, can you look for matches, in the Creative column of their data? Please be aware, that the tracking ID may not have been entered correctly, in their data. When a match is found, add a row to the new file. A row should contain all the columns, from both files, when a match can be found. I am looking for a C# solution, to parse the two files, and combine the matches into one file.

Please send your solution and the results file, in a zip file, within a week.
